

Virginia Tech Regional Math Contest 2002*

Problem 1. Let a, b be positive constants. Find the volume (in the first octant) which lies above the region in the xy -plane bounded by $x = 0$, $x = \pi/2$, $y = 0$, $y\sqrt{b^2 \cos^2 x + a^2 \sin^2 x} = 1$, and below the plane $z = y$.

Problem 2. Find rational numbers a, b, c, d, e such that

$$\sqrt{7 + \sqrt{40}} = a + b\sqrt{2} + c\sqrt{5} + d\sqrt{7} + e\sqrt{10}.$$

Problem 3. Let A and B be nonempty subsets of $S = \{1, 2, \dots, 99\}$ (integers from 1 to 99 inclusive). Let a and b denote the number of elements in A and B respectively, and suppose $a + b = 100$. Prove that for each integer s in S , there are integers x in A and y in B such that $x + y = s$ or $s + 99$.

Problem 4. Let $\{1, 2, 3, 4\}$ be a set of abstract symbols on which the associative binary operation $*$ is defined by the following operation table (associative means $(a * b) * c = a * (b * c)$):

	1	2	3	4
1	1	2	3	4
2	2	1	4	3
3	3	4	1	2
4	4	3	2	1

If the operation $*$ is represented by juxtaposition, e.g., $2 * 3$ is written as 23 etc., then it is easy to see from the table that of the four possible "words" of length two that can be formed using only 2 and 3, i.e., 22, 23, 32 and 33, exactly two, 22 and 33, are equal to 1. Find a formula for the number $A(n)$ of words of length n , formed by using only 2 and 3, that equal 1. From the table and the example just given for words of length two, it is clear that $A(1) = 0$ and $A(2) = 2$. Use the formula to find $A(12)$.

Problem 5. Let n be a positive integer. A bit string of length n is a sequence of n numbers consisting of 0's and 1's. Let $f(n)$ denote the number of bit strings of length n in which every 0 is surrounded by 1's. (Thus for $n = 5$, 11101 is allowed, but 10011 and 10110 are not allowed, and we have $f(3) = 2$, $f(4) = 3$.) Prove that $f(n) < (1.7)^n$ for all n .

Problem 6. Let S be a set of 2×2 matrices with complex numbers as entries, and let T be the subset of S consisting of matrices whose eigenvalues are ± 1 (so the eigenvalues for each matrix in T are $\{1, 1\}$ or $\{1, -1\}$ or $\{-1, -1\}$). Suppose there are exactly three matrices in T . Prove that there are matrices A, B in S such that AB is not a matrix in S . (Note: $A = B$ is allowed).

Problem 7. Let $\{a_n\}_{n \geq 1}$ be an infinite sequence with $a_n \geq 0$ for all n . For $n \geq 1$, let b_n denote the geometric mean of $a_1, \dots, a_n$, that is $(a_1 \dots a_n)^{1/n}$.

Suppose $\sum_{n=1}^{\infty} a_n$ is convergent. Prove that $\sum_{n=1}^{\infty} b_n$ is also convergent.
